# Stallion information 2008

# Stallion information

This 2008 Stallion Information is being presented to you as an aid in choosing a stallion. When choosing a stallion it is not just important to use the best-quality stallions but it is even more important to make the correct combinations. The KFPS strives to make as many breeding data on its stallions available as possible.

### Which stallions?

The stallions included in this edition are stallions that have been approved on offspring. Also the stallions have to be alive or be available by means of frozen semen.

### Which characteristics?

The following characteristics of the stallions are included.

1. Number/percentage of mares with the star predicate.
2. Breeding value linear exterior characteristics.
3. Breeding values for sport aptitude.

### Breeding values exterior and sport aptitude

Given the complexity of the breeding-value estimation for the exterior characteristics and sport aptitude an explanation of the origins and the interpretation of the numbers is necessary. In this explanation we also touch upon how the numbers can be used for choosing a stallion.

### The linear characteristics

The breeding values for the exterior characteristics are based on the linear scores, which since 1993 are documented for every studbook registration of the horses. Of the 25 exterior characteristics a score is given between 5 and 45, with as the average 25. In this edition for the first time the breeding values of the "new" linear characteristichs are included: length of the neck, body (uphill/downhill), and the trot characteristics balance and suppleness For the linear characteristics it specifically concerns an observation and not a rating. The characteristics have been chosen such that the linear report provides a picture of the horse's exterior that is as complete as possible. The breeding value estimation of the rated exterior numbers (breed type, builtd legs, walk, and trot) is currently being worked on. The linear characteristics can be divided in two categories.

1. The optimal characteristics: the characteristics for which the average score (25) or breeding value (100) is most desired. Examples of such characteristics are: shape of the back, conformation of the front legs, and shape of the hind legs.
2. Maximum characteristics: the characteristics for which goes the higher the better (example: expression of the face, expression of movement, etc.) or characteristics of which the optimum lies clearly above average, such as slope of the shoulder and shape of the croup. The difference has been visualized by depicting the breeding values for the optimal characteristics with dark-blue bars (favorable) and red bars (unfavorable), and the breeding values for the maximum characteristics with light-blue bars. In addition to the 25 linear characteristics the overview consists of a measured characteristic: the height at the withers.

### The rated characteristics

In addition to the 25 linear exterior characteristics also five rated characteristics are scored: breed type, build, legs, walk, and trot. For the linear characteristics it concerns a descriptive value, for the rated characteristics it concerns a rating. When evaluating the rated exterior characteristics the related linear characteristics play an important role. In addition non-linear scored segments can play a role. The characteristic trot, e.g., consists in addition to the linear characteristics length of the trot, strength of the trot, balance, and suppleness also of, e.g., rhythm/regularity of the trot. The rated characteristics are scored from 3 through 10.

### Sport aptitude

The breeding values are based on the ABFP results as these have been gathered by KFPS over the years, also as part of the testing on offspring. The reason that this particular data is used for the breeding-value estimation instead of, e.g. sport results, is the following.

1. ABFP information is available much earlier than sport data.
2. ABFP data is for a larger part hereditary (higher h2) than sport data. That is thanks to the uniform training, presentation, and evaluation.
3. Number of offspring per stallion in sport is in general (still) too low.
4. The ABFP data gives information on segments (basic gaits, suitability as show-driving horses, riding horses, and driving horses).

### The estimation model

The breeding values, estimated by the Nederlands Rundvee Syndicaat (NRS)/Dutch Cattle Syndicate, are estimated with a so-called estimation model. This estimation model indicates for which influences the differences between (in this case) stallions are corrected. The exterior scores are corrected for the following effects: breeding value of the dam of the offspring, age at the time of inspection, gender, linear evaluator, and inspection. This correction takes place to get as pure an insight as possible in to what degree the differences in offspring groups are caused by difference in genetic aptitude of the stallions. With these correction factors it basically does not matter in what area or on what mares a certain stallion is used. The kind of evaluation model that is being used is the so-called animal model. With an animal model in addition to data on offspring also information of family members is included. The contribution of this information declines as more information on the offspring becomes available.

### Interpretation of the breeding values

The breeding values are indicated in an average of 100 with a spread of 4 points. This basis was determined

# 2008

based on 2001. The average breeding values of all horses born in 2001 is for each characteristic set at 100 and the spread (standard deviation) of these breeding values is set at 4. Breeding values with a deviation compared to 100 of one time the spread (between 96 and 104) have to be considered as average. Over two thirds of the breeding values are in this margin. It goes without saying that the larger the deviation is compared to 100, the larger the expected effect is. A stallion with a breeding value of 109 or higher for, e.g., strength of movement, belongs to the 2% best stallions of the population. For a breeding value higher than 112 this is 0.1%. For the most recently published index the basis has been changed from 1991 to 2001. Given the fact that for most characteristics in this period of ten years the horses have improved genetically the stallions that already had breeding values have gone down a few index points. This decrease is equal for all stallions so that the ranking set forth by the base adjustment does not change.

### Depiction of the breeding values

The breeding values are indicated per characteristic with " bars." As mentioned the maximum characteristics are indicated by dark-blue bars (favourable) and red bars (unfavourable) and the optimal characteristics by light-blue bars. For the maximum characteristics goes that results to the left are unfavourable (red) and results to the right are favourable (dark-blue). For the optimal characteristics goes that (extreme) results to both the left and right are unfavourable; 100 is optimal here.

### Reliability

The degree to which the breeding value provides a precise image of the actual genetic aptitude of a stallion is expressed in the reliability (betrouwbaarheid / btbh.). The reliability is especially influenced by the number of inspected offspring. With a low reliability the breeding values can still change considerably when more offspring are inspected. The reliability can be interpreted as follows.

| Reliability | Interpretation |
|---|---|
| Less than 70% | moderately reliable |
| 70-80% | reasonably reliable |
| 80-90% | reliable |
| Over 90% | very reliable |

### Use of the exterior breeding values

The exterior breeding values are an excellent aid for making a correct mare-stallion combination. This can be done by looking at the mare's linear score form for the items that can be considered for correction. If the characteristic that needs to be corrected is a maximum characteristic then a stallion needs to be selected that has a (clearly) positive hereditary effect on this characteristic (bar to the right). If it concerns an optimal characteristic then the best choice is a stallion with an average breeding value or a slight deviation in the opposite direction, depending on the score of the mare.

A common misunderstanding is that when a mare scores, e.g., a 5 for the shape of the hind leg, is combined with a stallion that is rated 112 for this characteristic the offspring would have an average shape of the hind leg. For optimal characteristics stallions with a breeding value around 100 are recommended.

Use of the breeding values for sport aptitude
As you can see breeding values have been estimated for the basic gaits in the exterior bar and in the sport aptitude bar. The former is based on the evaluation of the basic gaits in the inspection ring (in hand), while the latter is based on the evaluation of the basic gaits in use (ABFP test). For most of the stallions these breeding values largely match. There are, however, stallions that have a breeding value for the basic gaits in the sport index that is quite a bit lower than the breeding value for the basic gaits in the exterior bar. Given the fact that the breeding goal indicates that we want to breed horses that have good gaits in especially their use the breeding values for sport aptitude should weigh more heavily in your evaluation of the stallions.

### Kinship percentage

The kinship percentage of the studbook stallions is listed. This number indicates the relationship of a stallion with the population. The lower the number, the higher the contribution is that such a stallion can make to blood distribution. The average percentage of the studbook stallions is approximately 17.5%. The kinship percentage is calculated by calculating the inbreeding of fictitious foals of the combination of all individual stallions with the mare population. The mare population is in this defined as all fillies born in the year 2006, in total over 3000 horses. Included in the inbreeding calculation are all known generations (so not just the first five generations). The kinship percentage is influenced by the level in which the lineage matches or deviates from the population. As a stallion is used more the relationship percentage will increase. The kinship percentage is one of the characteristics that is part of the selection of young stallions with as the goal to limit the increase in inbreeding. For the first time a correction has been made for missing pedigree information in the calculations of the relationship percentage in this publication. As a result the relationship percentage for stallions with a "short dam line" has been adjusted upward.

### Stallion information online

On the KFPS website (www.fps-studbook.com) a free digital version of the Stallion Information has been included in the member section. Here you will find even more detailed information about the stallions. Moreover, you may make stallion selections by indicating selection criteria. In the digital version of the Stallion Information are also included the stallions that have not yet participated in the testing on offspring.
